

# THUNDERWING™

## DIRECTIONS:

Place the kite on the ground so that the bridle is face up. It helps to have a friend hold onto the kite as you proceed. Detach the tow points of the bridle from the trailing edge loops. The bridle is shipped this way for tangle free storage and the loops can be used later for attaching tails. You should use the loops to re-attach the bridle when you are done flying to keep the bridle from tangling.

Attach the flying line to each of the bridles, preferably using a Larkshead knot (see below). Unroll the lines and do not cross them. Your right hand will control the line attached to the right bridle and the left hand will control the left bridle.

To launch the Thunderwing™, pull back quickly and evenly with both lines. Pull the right line towards you to make the kite go to the right and likewise to the left. Pull continuously on one line and the kite will go in a complete circle. Hold your hands evenly to make the kite go forward.

To land, fly the kite to your far right or left. The kite will start to descend. To prevent any accidental relaunching, have a friend grab it when it is on the ground.
